A captioned image

The figure on this page comes from one line of markdown:

```
![Mean ratings by condition.](ratings.png){#fig-ratings .wrap-right width="40%"}
```

Result

Participants rated each clip on a scale from one to five. Figure 1 shows the mean rating in each condition. Ratings in the treatment condition were higher than ratings in the control condition.

The figure keeps its number and its caption, and this paragraph can point to it with a `@fig-` link. The class `.wrap-right` puts the figure on the right side of the text, and the `width` attribute makes it 40% of the text width.

The paragraphs after the figure flow beside it until the text passes the bottom of the figure. After that, they run the full width of the text. Each format draws the same layout with its own tools: CSS in HTML, wrapfig in LaTeX, wrap-it in Typst, and a frame in Word.

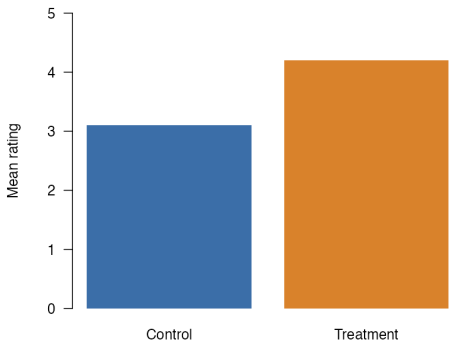

Figure 1: Mean ratings by condition.

Next

A heading is not a paragraph, so wrapping stops before it.
